DROP - N - TELL

For the safe transportation of Fragile materials, we recommend the **DROP-N-TELL** system. Like the **TIP-N-TELL** device, the **DROP-N-TELL** can be attached either out- side or inside the package to indicate whether the parcel was subjected to shock during shipment. It takes the guesswork out of knowing whether or not the package was dropped. In an instant, you'll know the answer.

RE-SETTABLE TYPE

The **DROP-N-TELL** is quickly attached with a pressure sensitive adhesive to either the packaging or the product itself. It can be reset and reused up to fifty times.

NON RE-SETTABLE TYPE

Non re-settable **DROP-N-TELL** indicators are also available. They are intended for use on the outside of the shipping container. Once triggered, there is no way they can be reset.

Once an impact exceeds the given G-range on either unit, black arrows snap into place indicating the package sustained a shock. Both **DROP-N-TELL**s are available in G-ranges 5, 10, 15, 25, 50 and 100 and come with warning labels for the container and bill of lading.

"...We have been using your indicators for about a year and have found that they made quite a difference in how our freight is handled. We have experienced fewer complaints from customers about damaged shipments, and we feel more confident that our equipment is being properly transported." **Marianne Honey-Project Co-ordinator - AERCO INT'L. INC.**
